## MMA8653FC 3-Axis, 10-bit Digital Accelerometer

The MMA8653FC is an intelligent, low-power, three-axis, capacitive micromachined accelerometer with 10 bits of resolution. This accelerometer is packed with embedded functions with flexible user-programmable options, configurable to two interrupt pins. Embedded interrupt functions enable overall power savings, by relieving the host processor from continuously polling data. There is access to either low-pass or high-pass filtered data, which minimizes the data analysis required for jolt detection and faster transitions. The device can be configured to generate inertial wake-up interrupt signals from any combination of the configurable embedded functions, enabling the MMA8653FC to monitor inertial events while remaining in a low-power mode during periods of inactivity. The MMA8653FC is available in a small 10-pin DFN package ( $2 \mathrm{~mm} \times 2 \mathrm{~mm} \times 1 \mathrm{~mm}$ ).

## Features

- 1.95 V to 3.6 V supply voltage
- 1.62 V to 3.6 V digital interface voltage
- $\pm 2 \mathrm{~g}, \pm 4 \mathrm{~g}$, and $\pm 8 \mathrm{~g}$ dynamically selectable full-scale ranges
- Output Data Rates (ODR) from 1.56 Hz to 800 Hz
- 10-bit digital output
- $\quad \mathrm{I}^{2} \mathrm{C}$ digital output interface with programmable interrupts
- One embedded channel of configurable motion detection (Freefall)
- Orientation (Portrait/Landscape) detection with fixed hysteresis of $15^{\circ}$.
- Configurable automatic ODR change triggered by the Auto-Wake/Sleep state change
- Self-Test

## Typical applications

- Tilt compensation in e-compass applications
- Static orientation detection (Portrait/Landscape, Up/Down, Left/Right, Back/ Front position identification)

- Notebook, tablet, e-reader, and laptop tumble and freefall detection
- Real-time orientation detection (virtual reality and gaming 3D user orientation feedback)
- Real-time activity analysis (pedometer step counting, freefall drop detection for HDD, dead-reckoning GPS backup)
- Motion detection for portable product power saving (Auto-SLEEP and Auto-WAKE for cell phone, PDA, GPS, gaming)
- Shock and vibration monitoring (mechatronic compensation, shipping and warranty usage logging)
- User interface (tilt menu scrolling)

| ORDERING INFORMATION |  |  |  |
| :---: | :---: | :---: | :---: |
| Part Number | Temperature Range | Package Description | Shipping |
| MMA8653FCR1 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | DFN-10 | Tape and Reel |

Freescale reserves the right to change the detail specifications as may be required to permit improvements in the design of its products.

## 1 Block Diagram and Pin Descriptions

### 1.1 Block diagram

Figure 1. MMA8653 block diagram

### 1.2 Pin descriptions

Figure 2. Pin connections (bottom view)
Table 1. Pin descriptions

| Pin \# | Pin Name | Description | Notes |
| :---: | :---: | :--- | :--- |
| 1 | VDD | Power supply | Device power is supplied through the VDD line. Power supply decoupling capacitors <br> should be placed as close as possible to pin 1 and pin 8 of the device. |
| 2 | SCL $^{(1)}$ | I $^{2}$ C Serial Clock | 7-bit $I^{2}$ C device address is 0x1D. |
| 3 | INT1 $^{\text {IN }}$ | Interrupt 1 output | The interrupt source and pin settings are user-programmable through the I ${ }^{2}$ C interface. |
| 4 | BYP | Internal regulator output <br> capacitor connection |  |
| 5 | INT2 | Interrupt 2 output | See INT1. |
| 6 | GND | Ground |  |
| 7 | GND | Ground |  |
| 8 | VDDIO $^{\text {Gigital Interface Power supply }}$ |  |  |
| 9 | GND $^{2}$ | Ground |  |
| 10 | SDA $^{(1)}$ | I $^{2}$ C Serial Data | See SCL. |

1. The control signals SCL and SDA are not tolerant of voltages higher than VDDIO +0.3 V . If VDDIO is removed, then the control signals SCL and SDA will clamp any logic signals with their internal ESD protection diodes. The SDA and SCL $1^{2} \mathrm{C}$ connections are open drain, and therefore require a pullup resistor to VDDIO.

### 1.3 Typical application circuit

Note: $4.7 \mathrm{k} \Omega$ Pullup resistors on $\operatorname{INT} 1 / \mathrm{INT} 2$ can be added for open-drain operation.

## 2 Mechanical and Electrical Specifications

### 2.1 Absolute maximum ratings

Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 2. Maximum ratings

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Maximum acceleration (all axes, $100 \mu \mathrm{~s})$ | $\mathrm{g}_{\text {max }}$ | 10,000 | g |
| Supply voltage | VDD | -0.3 to +3.6 | V |
| Input voltage on any control pin (SCL, SDA) | Vin | -0.3 to VDDIO +0.3 | V |
| Drop test | $\mathrm{D}_{\text {drop }}$ | 1.8 | m |
| Operating temperature range | $\mathrm{T}_{\text {OP }}$ | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature range | $\mathrm{T}_{\text {STG }}$ | -40 to +125 | ${ }^{\circ} \mathrm{C}$ |

Table 3. ESD and latch-up protection characteristics

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Human body model | HBM | $\pm 2000$ | V |
| Machine model | MM | $\pm 200$ | V |
| Charge device model | CDM | $\pm 500$ | V |
| Latch-up current at $\mathrm{T}=85^{\circ} \mathrm{C}$ | $\mathrm{I}_{\text {LU }}$ | $\pm 100$ | mA |

This device is sensitive to mechanical shock. Improper handling can cause permanent damage to the part.

This part is ESD-sensitive. Improper handling can cause permanent damage to the part.

| Pulse width of spikes on SDA and SCL that must be suppressed by internal input filter | ${ }^{\text {tsp }}$ | 0 | 50 | ns |
| Capacitive load for each bus line | Cb |  | 400 | pF |

1. All values referred to $\mathrm{VIH}(\min )(0.3 \mathrm{VDD})$ and $\mathrm{VIL}(\max )(0.7 \mathrm{VDD})$ levels.
2. This device does not stretch the LOW period (tLOW) of the SCL signal.
3. $\mathrm{C}_{\mathrm{b}}=$ total capacitance of one bus line in pF .
4. $\mathrm{t}_{\mathrm{VD} ; \mathrm{DAT}}=$ time for data signal from SCL LOW to SDA output (HIGH or LOW, depending on which one is worse).
5. $\mathrm{t}_{\mathrm{VD} ; \mathrm{ACK}}=$ time for Acknowledgement signal from SCL LOW to SDA output (HIGH or LOW, depending on which one is worse).

Figure 4. $I^{2} \mathrm{C}$ slave timing diagram

## MMA8653FC

## 3 Terminology

### 3.1 Sensitivity

The sensitivity is represented in counts/g.

- $\quad \mathrm{In} \pm 2 \mathrm{~g}$ mode, sensitivity $=256$ counts/g.
- $\quad \mathrm{In} \pm 4 \mathrm{~g}$ mode, sensitivity $=128$ counts/g.
- In $\pm 8$ g mode, sensitivity $=64$ counts/g.

### 3.2 Zero-g offset

Zero-g Offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if the sensor is stationary. A sensor stationary on a horizontal surface will measure 0 g in X -axis and 0 g in Y -axis, whereas the Z -axis will measure 1 g . The output is ideally in the middle of the dynamic range of the sensor (content of OUT Registers 0x00, data expressed as a 2 's complement number). A deviation from ideal value in this case is called Zero-g offset.

Offset is to some extent a result of stress on the MEMS sensor, and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress.

### 3.3 Self-Test

Self-Test can be used to verify the transducer and signal chain functionality without the need to apply external mechanical stimulus.

When Self-Test is activated:

- An electrostatic actuation force is applied to the sensor, simulating a small acceleration. In this case, the sensor outputs will exhibit a change in their DC levels which, are related to the selected full scale through the device sensitivity.
- The device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force.

Figure 5. Operating modes for MMA8653FC
Table 7. Operating modes

| Mode | $\mathrm{I}^{2} \mathrm{C}$ Bus State | VDD | VDDIO | Description |
| :---: | :---: | :---: | :---: | :---: |
| OFF | Powered down | <1.8 V | VDDIO can be > VDD | - The device is powered off. <br> - All analog and digital blocks are shutdown. <br> - ${ }^{2} \mathrm{C}$ bus inhibited. |
| STANDBY | $1^{2} \mathrm{C}$ communication with MMA8653FC is possible | ON | $\begin{aligned} & \text { VDDIO = High } \\ & \text { VDD = High } \end{aligned}$ <br> ACTIVE bit is cleared | - Only digital blocks are enabled. <br> - Analog subsystem is disabled. <br> - Internal clocks disabled. |
| ACTIVE (WAKE/SLEEP) | $1^{2} \mathrm{C}$ communication with MMA8653FC is possible | ON | $\begin{aligned} & \text { VDDIO = High } \\ & \text { VDD = High } \\ & \text { ACTIVE bit is set } \end{aligned}$ | All blocks are enabled (digital, analog). |

Some registers are reset when transitioning from STANDBY to ACTIVE. These registers are all noted in the device memory map register table.

The SLEEP and WAKE modes are ACTIVE modes. For more information about how to use the SLEEP and WAKE modes and how to transition between these modes, see Section 5.

## 5 Functionality

The MMA8653FC is a low-power, digital output 3-axis linear accelerometer with $\mathrm{al}^{2} \mathrm{C}$ interface with embedded logic used to detect events and notify an external microprocessor over interrupt lines.

- 8-bit or 10-bit data
- Four different oversampling options that allow for the optimum resolution vs. current consumption trade-off to be made for a given application
- Low-power and auto-WAKE/SLEEP modes for reducing current consumption
- Freefall detection (one channel)
- Single default angle for portrait landscape detection algorithm, for addressing screen orientation
- Two independent interrupt output pins that are programmable among four interrupt sources (Data Ready, Freefall, Orientation, Auto-WAKE)

All functionality is available in $\pm 2 \mathrm{~g}, \pm 4 \mathrm{~g}$ or $\pm 8 \mathrm{~g}$ dynamic measurement ranges. There are many configuration settings for enabling all of the different functions. Separate application notes are available to help configure the device for each embedded functionality.

### 5.1 Device calibration

The device is factory calibrated for sensitivity and Zero-g offset for each axis. The trim values are stored in Non-Volatile Memory (NVM). On power-up, the trim parameters are read from NVM and applied to the circuitry. In normal use, further calibration in the end application is not necessary. However, the MMA8653FC allows you to adjust the offset for each axis after power-up, by changing the default offset values. The user offset adjustments are stored in three volatile 8-bit registers (OFF_X, OFF_Y, OFF_Z).

### 5.2 8-bit or 10-bit data

The measured acceleration data is stored in the following registers as 2's complement 10-bit numbers:

- OUT_X_MSB, OUT_X_LSB
- OUT_Y_MSB, OUT_Y_LSB
- OUT_Z_MSB, OUT_Z_LSB

The most significant eight bits of each axis are stored in OUT_X $(\mathrm{Y}, \mathrm{Z})$ _MSB, so applications needing only 8-bit results can use these three registers (and ignore the OUT_X/Y/Z_LSB registers). To use only 8-bit results, the F_READ bit in CTRL_REG1 must be set. When the F_READ bit is cleared, the fast read mode is disabled.

- When the full-scale is set to $\mathbf{\pm} \mathbf{g}$, the measurement range is -2 g to +1.996 g , and each count corresponds to (1/256) g ( 3.8 mg ) at 10-bit resolution.
- When the full-scale is set to $\pm \mathbf{~} \mathbf{g}$, the measurement range is -4 g to +3.992 g , and each count corresponds to (1/128) g
- $\quad(7.8 \mathrm{mg})$ at 10 -bit resolution.
- When the full-scale is set to $\pm 8 \mathbf{g}$, the measurement range is -8 g to +7.984 g , and each count corresponds to (1/64) g ( 15.6 mg ) at 10-bit resolution.
- If only the 8-bit results are used, then the resolution is reduced by a factor of 16 .

For more information about the data manipulation between data formats and modes, see application note AN4083, Data Manipulation and Basic Settings for Xtrinsic MMA865xFC Accelerometers. There is a device driver available that can be used with the Sensor Toolbox demo board (LFSTBEB865xFC) with this application note.

Table 8. Accelerometer 10-bit output data

### 5.3 Low power modes vs. high resolution modes

The MMA8653FC can be optimized for lower power modes or for higher resolution of the output data. One of the oversampling schemes of the data can be activated when MODS $=10$ in Register 0x2B, which will improve the resolution of the output data only. The highest resolution is achieved at 1.56 Hz .

There is a trade-off between low power and high resolution. Low power can be achieved when the oversampling rate is reduced. When MODS $=11$, the lowest power is achieved. The lowest power is achieved when the sample rate is set to 1.56 Hz .

### 5.4 Auto-WAKE/SLEEP mode

The MMA8653FC can be configured to transition between sample rates (with their respective current consumption) based on four of the interrupt functions of the device. The advantage of using the Auto-WAKE/SLEEP is that the system can automatically transition to a higher sample rate (higher current consumption) when needed, but spends the majority of the time in the SLEEP mode (lower current) when the device does not require higher sampling rates.

- Auto-WAKE refers to the device being triggered by one of the interrupt functions to transition to a higher sample rate. This may also interrupt the processor to transition from a SLEEP mode to a higher power mode.
- SLEEP mode occurs after the accelerometer has not detected an interrupt for longer than the user-definable timeout period. The device will transition to the specified lower sample rate. It may also alert the processor to go into a lower power mode, to save on current during this period of inactivity.

The Interrupts that can WAKE the device from SLEEP are Orientation detection and Freefall detection. The interrupts that can keep the device from falling asleep are the same interrupts that can wake the device.

## MMA8653FC

### 5.5 Freefall detection

MMA8653FC has an interrupt architecture for detecting a Freefall.

- Freefall can be enabled.
- Freefall is detected when the acceleration magnitude is less than the configured threshold.

The freefall configuration does not use a high-pass filter.
The detection of "Freefall" involves the monitoring of the $\mathrm{X}, \mathrm{Y}$, and Z axes for the condition where the acceleration magnitude is below a user-specified threshold for a user-definable amount of time. Usable threshold levels are typically between $\pm 100 \mathrm{mg}$ and $\pm 500 \mathrm{mg}$.

### 5.6 Orientation detection

The MMA8653FC incorporates an advanced orientation detection algorithm with the ability to detect all six orientations shown in Figure 6. The algorithm uses a single default trip point setting. The transition from portrait to landscape is fixed at $45^{\circ}$ midpoint angle and $\pm 15^{\circ}$ hysteresis angle. This allows for smooth transitions from portrait to landscape at approximately $30^{\circ}$ and landscape to portrait at approximately $60^{\circ}$ (Figure 7).

Zout @ 1 g

(Top View)
Direction of the
Detectable Accelerations

Figure 6. Sensitive axes orientation

Figure 7. Landscape-to-Portrait transition trip angles
Based on the known functionality of linear accelerometers, when a device is oriented at a certain angle from flat and the device is rotating at slow angular speeds about the Z-axis, it is not possible to detect changes in acceleration. The angle at which the device no longer detects the orientation change is referred to as the "Z-lockout angle" (Figure 8).

The MMA8653FC orientation detection algorithm is configured to operate when the device is oriented at an angle of $29^{\circ}$ or greater from flat (Zout $=-1 \mathrm{~g}$ or Zout $=1 \mathrm{~g}$ ), with an accuracy of $\pm 2^{\circ}$.

When lifting the device upright from the flat position, orientation detection will be active for orientation angles greater than $29^{\circ}$ from flat. This is the only setting available.

Figure 8. Z-Tilt angle lockout transition

### 5.7 Interrupt register configurations

There are four configurable interrupts in the MMA8653FC: Data Ready, Motion/Freefall, Orientation, and Auto-SLEEP events.

These four interrupt sources can be routed to one of two interrupt pins.

The interrupt source must be enabled and configured.

If the event flag is asserted because the event condition is detected, then the corresponding interrupt pin (INT1 or INT2) will assert.

Figure 9. System interrupt generation

- The MMA8653FC features an interrupt signal that indicates when a new set of measured acceleration data is available, thus simplifying data synchronization in the digital system that uses the device.
- The MMA8653FC may also be configured to generate other interrupt signals accordingly, to the programmable embedded functions of the device for Motion, Freefall, and Orientation.

## $5.8 \quad$ Serial ${ }^{2} \mathrm{C}$ interface

Acceleration data may be accessed through an $I^{2} \mathrm{C}$ interface, thus making the device particularly suitable for direct interfacing to a microcontroller. The acceleration data and configuration registers embedded inside the MMA8653FC are accessed through the $\mathrm{I}^{2} \mathrm{C}$ serial interface (Table 10).

- To enable the $I^{2} \mathrm{C}$ interface, VDDIO line must be tied high (to the interface supply voltage). If VDD is not present and VDDIO is present, then the MMA8653FC is in OFF mode-and communications on the $I^{2} \mathrm{C}$ interface are ignored.
- The $I^{2} \mathrm{C}$ interface may be used for communications between other $\mathrm{I}^{2} \mathrm{C}$ devices; the MMA8653FC does not affect the $\mathrm{I}^{2} \mathrm{C}$ bus.

Table 10. Serial Interface pins

| Pin Name | Pin Description | Notes |
| :---: | :--- | :--- |
| SCL | $1^{2} C$ Serial Clock | There are two signals associated with the $I^{2} C$ bus; the Serial Clock Line (SCL) and the |
| Serial Data line (SDA). |  |  |
| SDA | $I^{2} C$ Serial Data | SDA is a bidirectional line used for sending and receiving the data to/from the interface. <br> external pullup resistors connected to VDDIO are expected for SDA and SCL. When the bus <br> is free, both SCL and SDA lines are high. |

The $I^{2} \mathrm{C}$ interface is compliant with Fast mode ( 400 kHz ), and Normal mode ( 100 kHz ) $\mathrm{I}^{2} \mathrm{C}$ standards (Table 11).

## $I^{2} C$ operation:

1. The transaction on the bus is started through a start condition (START) signal. A START condition is defined as a high-tolow transition on the data line while the SCL line is held high. After START has been transmitted by the Master, the bus is considered busy.
2. The next byte of data transmitted after START contains the slave address in the first seven bits. The eighth bit tells whether the Master is receiving data from the slave or is transmitting data to the slave.
3. After a start condition and when an address is sent, each device in the system compares the first seven bits with its address. If the device's address matches the sent address, then the device considers itself addressed by the Master.

MMA8653FC

## Sensors

4. The 9th clock pulse following the slave address byte (and each subsequent byte) is the acknowledge (ACK). The transmitter must release the SDA line during the ACK period. The receiver must then pull the data line low, so that it remains stable low during the high period of the acknowledge clock period.
5. A Master may also issue a repeated START during a data transfer. The MMA8653FC expects repeated STARTs to be used to randomly read from specific registers.
6. A low-to-high transition on the SDA line while the SCL line is high is defined as a stop condition (STOP). A data transfer is always terminated by a STOP.

The MMA8653FC's standard slave address is 0011101 or $0 \times 01 \mathrm{D}$.

Table 11. $\mathrm{I}^{2} \mathrm{C}$ Device address sequence

| Command | $[6: 0]$ <br> Device address | $[6: 0]$ <br> Device address | R/W | 8-bit final <br> value |
| :---: | :---: | :---: | :---: | :---: |
| Read | 0011101 | $0 \times 1 \mathrm{D}$ | 1 | $0 \times 3 \mathrm{~B}$ |
| Write | 0011101 | $0 \times 1 \mathrm{D}$ | 0 | $0 \times 3 \mathrm{~A}$ |

### 5.8.1 Single-byte read

1. The transmission of an 8-bit command begins on the falling edge of SCL. After the eight clock cycles are used to send the command, note that the data returned is sent with the MSB first after the data is received. Figure 10 shows the timing diagram for the accelerometer 8 -bit $\mathrm{I}^{2} \mathrm{C}$ read operation.
2. The Master (or MCU) transmits a start condition (ST) to the MMA8653FC [slave address (0x1D), with the R/W bit set to " 0 " for a write], and the MMA8653FC sends an acknowledgement.
3. Next the Master (or MCU) transmits the address of the register to read, and the MMA8653FC sends an acknowledgement.
4. The Master (or MCU) transmits a repeated start condition (SR) and then addresses the MMA8653FC (0x1D), with the R/W bit set to " 1 " for a read from the previously selected register.
5. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NAK) the transmitted data, but transmits a stop condition to end the data transfer.

Figure 10. Single-Byte Read timing $\left(I^{2} C\right)$

## NOTE

For the following subsections, use the following legend.

## Legend

ST: Start Condition
SP: Stop Condition
SR: Repeated Start Condition AK: Acknowledge
NAK: No Acknowledge W: Write $=0$

### 5.8.2 Multiple byte read

(See Table 11 for next auto-increment address.)

1. When performing a multi-byte read or "burst read", the MMA8653FC automatically increments the received register address commands after a read command is received.
2. After following the steps of a single byte read, multiple bytes of data can be read from sequential registers after each MMA8653FC acknowledgment (AK) is received,
3. Until a no acknowledge (NAK) occurs from the Master,
4. Followed by a stop condition (SP), which signals the end of transmission.

## MMA8653FC

## Figure 11. Multiple Byte Read timing $\left(I^{2} \mathrm{C}\right)$

### 5.8.3 Single byte write

1. To start a write command, the Master transmits a start condition (ST) to the MMA8653FC, slave address (\$1D) with the R/W bit set to "0" for a write,
2. The MMA8653FC sends an acknowledgement.
3. Next the Master (MCU) transmits the address of the register to write to, and the MMA8653FC sends an acknowledgement.
4. Then the Master (or MCU) transmits the 8-bit data to write to the designated register, and the MMA8653FC sends an acknowledgement that it has received the data. Because this transmission is complete, the Master transmits a stop condition (SP) to the data transfer. The data sent to the MMA8653FC is now stored in the appropriate register.

Figure 12. Single Byte Write timing $\left(I^{2} C\right)$

### 5.8.4 Multiple byte write

(See Table 11 for next auto-increment address.)

1. After a write command is received, the MMA8653FC automatically increments the received register address commands.
2. Therefore, after following the steps of a single byte write, multiple bytes of data can be written to sequential registers after each MMA8653FC acknowledgment (ACK) is received.

Figure 13. Multiple Byte Write timing ( $\left(^{2} \mathrm{C}\right)$

Note: Bits showing "-" can read as either 0 or 1 , and these bits have no definition.

### 6.3 Data registers

The following are the data registers for the MMA8653FC device. For more information about data manipulation in the MMA8653FC, see application note AN4083, Data Manipulation and Basic Settings for Xtrinsic MMA865xFC Accelerometers.

- When accessing the 8-bit data, the F_READ bit (register 0x2A) is set, which modifies the auto-incrementing to skip over the LSB data.
- When the F_READ bit is cleared, the 12 -bit data is read, accessing all 6 bytes sequentially ( $X$ _MSB, $X$ _LSB, $Y$ _MSB, Y_LSB, Z_MSB, Z_LSB).

### 6.3.1 0x00: STATUS Data Status register

Data Status register $0 \times 00$ reflects the real-time status information of the $X, Y$ and $Z$ sample data; it contains the $X, Y$, and $Z$ data overwrite and data ready flag.

These registers contain the X-axis, Y-axis, and Z-axis 12-bit output sample data (expressed as 2's complement numbers).
Table 14. 0x00 STATUS: Data Status register (Read-Only) Back to Register Address Map

- OUT_X_MSB, OUT_X_LSB, OUT_Y_MSB, OUT_Y_LSB, OUT_Z_MSB, and OUT_Z_LSB are stored in the autoincrementing address range of $0 \times \overline{01}-0 \times 06$, to reduce reading the status followed $\overline{b y} \overline{10}-$ bit axis data to 7 bytes. If the F_READ bit is set ( $0 \times 2$ A bit 1 ), then auto-increment will skip over LSB registers (to access the MSB data only). This will shorten the data acquisition from seven bytes to four bytes.
- The LSB registers can only be read immediately following the read access of the corresponding MSB register.
- A random read access to the LSB registers is not possible.
- Reading the MSB register and then the LSB register in sequence ensures that both bytes (LSB and MSB) belong to the same data sample, even if a new data sample arrives between reading the MSB and the LSB byte.

### 6.4 System status and ID registers

### 6.4.1 0x0B: SYSMOD System Mode register

The System mode register indicates the current device operating mode. Applications using the Auto-SLEEP/WAKE mechanism should use the SYSMOD register to synchronize the application with the device operating mode transitions.

Table 22. 0x0B SYSMOD: System Mode register (Read-Only)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

| $1-0$ | SYSMOD[1:0] | System Mode <br> 00 STANDBY mode (default) <br> 01 <br> WAKE mode <br> 10 |  |

### 6.4.2 0x0C: INT_SOURCE System Interrupt Status register

In the interrupt source register, the status of the various embedded features can be determined.

- The bits that are set (logic ' 1 ') indicate which function has asserted an interrupt.
- The bits that are cleared (logic '0') indicate which function has not asserted (or has deasserted) an interrupt.

INT_SOURCE register bits are set by a low-to-high transition, and are cleared by reading the appropriate interrupt source register. For example, the SRC_DRDY bit is cleared when the ZYXDR bit (STATUS register) is cleared, but the SRC_DRDY bit is not cleared by simply reading the STATUS register ( $0 \times 00$ ), but is cleared by reading all the $\mathrm{X}, \mathrm{Y}$, and Z MSB data.

Table 24. 0x0C INT_SOURCE: System Interrupt Status register (Read Only)

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit $\mathbf{1}$ | Bit 0 |

## MMA8653FC

Table 25. INT_SOURCE register

| Bit(s) | Field | Description |
| :---: | :---: | :---: |
| 7 | SRC_ASLP | Auto-SLEEP/WAKE interrupt status bit <br> - WAKE-to-SLEEP transition occurs when no interrupt occurs for a time period that exceeds the userspecified limit (ASLP_COUNT). This causes the system to transition to a user-specified low ODR setting. <br> - SLEEP-to-WAKE transition occurs when the user-specified interrupt event has woken the system; thus causing the system to transition to a user-specified high ODR setting. <br> - Reading the SYSMOD register clears the SRC_ASLP bit. <br> 1 An interrupt event that can cause a WAKE-to-SLEEP or SLEEP-to-WAKE system mode transition has occurred. <br> 0 No WAKE-to-SLEEP or SLEEP-to-WAKE system mode transition interrupt event has occurred. (default) |
| 6 | 0 |  |
| 5 | 0 |  |
| 4 | SRC_LNDPRT | Landscape/Portrait Orientation interrupt status bit <br> - SRC_LNDPRT bit is asserted whenever the NEWLP bit (PL_STATUS register) is asserted and the interrupt has been enabled. <br> - SRC_LNDPRT bit is cleared by reading the PL_STATUS register. <br> 1 An interrupt was generated due to a change in the device orientation status. <br> 0 No change in orientation status was detected. (default) |
| 3 | 0 |  |
| 2 | SRC_FF_MT | Freefall/Motion interrupt status bit <br> - SRC_FF_MT bit is asserted whenever the EA bit (FF_MT_SRC register) is asserted and the FF_MT interrupt has been enabled. <br> - SRC_FF_MT bit is cleared by reading the FF_MT_SRC register. <br> 1 The Freefall/Motion function interrupt is active. <br> 0 No Freefall or Motion event was detected. (default) |
| 1 | 0 |  |
| 0 | SRC_DRDY | Data Ready Interrupt bit status bit <br> - SRC_DRDY bit is asserted when the ZYXOW and/or ZYXDR bit is set and the interrupt has been enabled. <br> - SRC_DRDY bit is cleared by reading the $X, Y$, and $Z$ data. <br> 1 The $X, Y, Z$ data ready interrupt is active (indicating the presence of new data and/or data overrun). <br> 0 The $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ interrupt is not active. (default) |

### 6.4.3 0x0D: WHO_AM_I Device ID register

The device identification register identifies the part. The default value is $0 \times 5 \mathrm{~A}$ (for MMA8653FC).
This value is programmed by Freescale before the part leaves the factory. For custom alternate values, contact Freescale.
Table 26. 0x0D: WHO_AM_I Device ID register (Read-Only)

### 6.6 Portrait/Landscape configuration and status registers

For more information about the different user-configurable settings and example code, see application note AN4083, Data Manipulation and Basic Settings for Xtrinsic MMA865xFC Accelerometers.

### 6.6.1 $0 \times 10$ : PL_STATUS Portrait/Landscape Status register

To get updated information on any change in orientation, read the Portrait/Landscape Status register (read Bit 7, or read the other bits for more orientation data). For more about Portrait Up, Portrait Down, Landscape Left, Landscape Right, Back, and Front orientations, see Figure 6. The interrupt is cleared when reading the PL_STATUS register.

Table 30. 0x10 PL_STATUS Register (Read-Only)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

| 0 | BAFRO | Back or Front orientation <br> 0 Front: Equipment is in the front-facing orientation (default) <br> 1 Back: Equipment is in the back-facing orientation |

1. The default power-up state is $B A F R O=0, L A P O=00$, and $L O=0$.

- The orientation mechanism state change is limited to a maximum 1.25 g .

The current position is locked if the absolute value of the acceleration experienced on any of the three axes is greater than 1.25 g .

- LAPO, BAFRO, and LO continue to change when NEWLP is set.

### 6.6.2 0x11 Portrait/Landscape Configuration register

The Portrait/Landscape Configuration register enables the portrait/landscape function and sets the behavior of the debounce counter.

Table 32. 0x11 PL_CFG register (Read/Write)
Back to Register Address Map

| 7 | DBCNTM | Debounce counter mode selection <br> 0 Decrements debounce whenever the condition of interest is no longer valid. <br> 1 Clears the counter whenever the condition of interest is no longer valid. (default) |
| 6 | PL_EN | Portrait/Landscape detection enable <br> 0 Portrait/Landscape Detection is disabled. (default) <br> 1 Portrait/Landscape Detection is enabled. |
| 5-0 | 0 |  |

### 6.6.3 0x12 Portrait/Landscape Debounce register

The Portrait/Landscape Debounce register sets the debounce count for the orientation state transition. The minimum debounce latency is determined by the data rate (which is set by the product of the selected system ODR and PL_COUNT registers). Any transition from WAKE to SLEEP (or SLEEP to Wake) resets the internal Landscape/Portrait debounce counter.

## NOTE

The debounce counter weighting (time step) changes, based on the ODR and the Oversampling mode. Table 36 explains the time step value for all sample rates and all Oversampling modes.

Table 34. 0x12 PL_COUNT register (Read/Write)

### 6.7 Freefall/Motion configuration and status registers

The freefall/motion function can be configured in either Freefall or Motion Detection mode via the OAE configuration bit ( $0 \times 15$ : FF_MTG_CFG, bit 6). The freefall/motion detection block can be disabled by setting all three bits (ZEFE, YEFE, XEFE) to zero.

Depending on the register bits ELE (0x15: FF_MTG_CFG, bit 7) and OAE (0x15: FF_MTG_CFG, bit 6), each of the freefall and motion detection block can operate in four different modes.

### 6.7.1 Motion and freefall modes

### 6.7.1.1 Mode 1: Freefall detection with $\mathrm{ELE}=0, \mathrm{OAE}=0$

In this mode, the EA bit ( $0 \times 16$ : FF_MTG_CFG, bit 7) indicates a freefall event after the debounce counter is complete. The ZEFE, YEFE, and XEFE control bits determine which axes are considered for the freefall detection. Once the EA bit is set, and DBCNTM $=0$, the EA bit can get cleared only after the delay specified by FF_MT_COUNT. This is because the counter is in decrement mode. If DBCNTM $=1$, then the EA bit is cleared as soon as the freefall condition disappears, and will not be set again before the delay specified by FF_MT_COUNT has passed. Reading the FF_MT_SRC register does not clear the EA bit.

The event flags ( $0 \times 16$ ) ZHE, ZHP, YHE, YHP, XHE, and XHP reflect the motion detection status (i.e., a high g event) without any debouncing, provided that the corresponding bits ZEFE, YEFE, and/or XEFE are set.

### 6.7.1.2 Mode 2: Freefall detection with $E L E=1, O A E=0$

In this mode, the EA event bit indicates a freefall event after the debounce counter. Once the debounce counter reaches the time value for the set threshold, the EA bit is set, and the EA bit remains set until the FF_MT_SRC register is read. When the FF_MT_SRC register is read, the EA bit and the debounce counter are cleared, and a new event can only be generated after the delay specified by FF_MT_CNT. The ZEFE, YEFE, and XEFE control bits determine which axes are considered for the freefall detection. While $\mathrm{EA}=0$, the event flags $\mathrm{ZHE}, \mathrm{ZHP}, \mathrm{YHE}, \mathrm{YHP}, \mathrm{XHE}$, and XHP reflect the motion detection status (i.e., a high g event) without any debouncing, provided that the corresponding bits ZEFE, YEFE, and/or XEFE are set.

The event flags ZHE, ZHP, YHE, YHP, XHE, and XHP are latched when the EA event bit is set. The event flags ZHE, ZHP, YHE, YHP, XHE, and XHP will start changing only after the FF_MT_SRC register has been read.

### 6.7.1.3 Mode 3: Motion detection with ELE = O, OAE $=1$

In this mode, the EA bit indicates a motion event after the debounce counter time is reached. The ZEFE, YEFE, and XEFE control bits determine which axes are taken into consideration for motion detection. Once the EA bit is set and if DBCNTM = 0, the EA bit can get cleared only after the delay specified by FF_MT_COUNT. If DBCNTM $=1$, then the EA bit is cleared as soon as the motion high g condition disappears.

The event flags ZHE, ZHP, YHE, YHP, XHE, and XHP reflect the motion detection status (i.e., a high g event) without any debouncing, provided that the corresponding bits ZEFE, YEFE, and/or XEFE are set. Reading the FF_MT_SRC does not clear any flags, nor is the debounce counter reset.

### 6.7.1.4 Mode 4: Motion detection with ELE $=1, O A E=1$

In this mode, the EA bit indicates a motion event after debouncing. The ZEFE, YEFE, and XEFE control bits determine which axes are taken into consideration for motion detection. Once the debounce counter reaches the threshold, the EA bit is set, and the EA bit remains set until the FF_MT_SRC register is read. When the FF_MT_SRC register is read, all register bits are cleared and the debounce counter are cleared and a new event can only be generated after the delay specified by FF_MT_CNT.

While the bit EA is zero, the event flags ZHE, ZHP, YHE, YHP, XHE, and XHP reflect the motion detection status (i.e., a high g event) without any debouncing, provided that the corresponding bits ZEFE, YEFE, and/or XEFE are set. When the EA bit is set, these bits (ZHE, ZHP, YHE, YHP, XHE, XHP) keep their current value until the FF_MT_SRC register is read.

## MMA8653FC

### 6.7.2 0x15: FF_MT_CFG Freefall/Motion Configuration register

This is the Freefall/Motion configuration register for setting up the conditions of the freefall or motion function.

MMA8653FC

## Sensors

### 6.7.3 0x16: FF_MT_SRC Freefall/Motion Source register

The Freefall/Motion Source register keeps track of the acceleration event that is triggering (or has triggered, if ELE bit in FF_MT_CFG register is set to 1 ) the event flag. In particular, EA is set to 1 when the logical combination of acceleration events flags specified in FF_MT_CFG register is true. This EA bit is used in combination with the values in INT_EN_FF_MT and INT_CFG_FF_MT register bits to generate the freefall/motion interrupts.

- An $X, Y$, or $Z$ motion is true when the acceleration value of the $X$ or $Y$ or $Z$ channel is higher than the preset threshold value defined in the FF_MT_THS register.
- An $X, Y$, and $Z$ low event is true when the acceleration value of the $X$ and $Y$ and $Z$ channel is lower than or equal to the preset threshold value defined in the FF_MT_THS register.

| 7 | EA | Event Active flag <br> 0 No event flag has been asserted (default) <br> 1 One or more event flags has been asserted. <br> See the description of the OAE bit to determine the effect of the 3 -axis event flags on the EA bit. |
| 6 | 0 |  |
| 5 | ZHE | Z-Motion flag <br> ZHE bit always reads zero if the ZEFE control bit is set to zero. <br> 0 No Z motion event detected (default) <br> 1 Z motion has been detected |
| 4 | ZHP | Z-Motion Polarity Flag <br> ZHP bit always reads zero if the ZEFE control bit is set to zero. <br> 0 Z event was positive g (default) <br> 1 Z event was negative g |
| 3 | YHE | Y-Motion Flag <br> YHE bit always reads zero if the YEFE control bit is set to zero. <br> 0 No Y motion event detected (default) <br> 1 Y motion has been detected |
| 2 | YHP | Y-Motion Polarity Flag <br> YHP bit always reads zero if the YEFE control bit is set to zero. <br> 0 Y event detected was positive g (default) <br> 1 Y event was negative g |
| 1 | XHE | X-Motion Flag <br> XHE bit always reads zero if the XEFE control bit is set to zero. <br> 0 No X motion event detected (default) <br> 1 X motion has been detected |
| 0 | XHP | X-Motion Polarity Flag <br> XHP bit always reads zero if the XEFE control bit is set to zero. <br> 0 X event was positive g (default) <br> 1 X event was negative g |

### 6.7.4 0x17: FF_MT_THS Freefall and Motion Threshold register

FF_MT_THS is the threshold register used to detect freefall motion events.

- The unsigned 7-bit FF_MT_THS threshold register holds the threshold for the freefall detection where the magnitude of the $X$ and $Y$ and $Z$ acceleration values is lower or equal than the threshold value.
- Conversely, the FF_MT_THS also holds the threshold for the motion detection where the magnitude of the $\mathbf{X}$ or $\mathbf{Y}$ or $\mathbf{Z}$ acceleration value is higher than the threshold value.

Table 45. 0x17 FF_MT_THS register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DBCNTM | THS6 | THS5 | THS4 | THS3 | THS2 | THS1 | THS0 |

Table 46. FF_MT_THS register

| Bit(s) | Field | Description |
| :---: | :---: | :--- |
| 7 | DBCNTM | Debounce counter mode selection <br> 0 <br> 1 <br> Increments or decrements debounce (default) |
| $6-0$ | Increments or clears counter. |  |

The threshold resolution is $0.063 \mathrm{~g} / \mathrm{LSB}$ and the threshold register has a range of 0 to 127 counts. The maximum range is to $\pm 8 \mathrm{~g}$. Note that even when the full scale value is set to $\pm 2 \mathrm{~g}$ or $\pm 4 \mathrm{~g}$, the motion still detects up to $\pm 8 \mathrm{~g}$.

The DBCNTM bit configures the way in which the debounce counter is reset when the inertial event of interest is momentarily not true.

- When the DBCNTM bit is 1 , the debounce counter is cleared to 0 whenever the inertial event of interest is no longer true as shown in Figure 15, (b).
- While the DBCNTM bit is set to $\mathbf{0}$, the debounce counter is decremented by 1 whenever the inertial event of interest is no longer true (Figure 15, (c)) until the debounce counter reaches 0 or until the inertial event of interest becomes active.
Decrementing the debounce counter acts as a median enabling the system to filter out irregular spurious events (which might impede the detection of inertial events).

### 6.7.5 0x18 FF_MT_COUNT Debounce register

The Debounce register sets the number of debounce sample counts for the event trigger.
Table 47. 0x18 FF_MT_COUNT register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

## Table 48. FF_MT_COUNT register

| Bit(s) | Field |  | Description |
| :---: | :---: | :--- | :--- |
| $7-0$ | $D[7: 0]$ | Count value <br> $0000 \_0000$ (default) |  |

The Debounce register sets the minimum number of debounce sample counts that continuously match the detection condition selected by you for the freefall/motion event.
When the internal debounce counter reaches the FF_MT_COUNT value, a freefall/motion event flag is set. The debounce counter will never increase beyond the FF_MT_COUNT value. The time step used for the debounce sample count depends on the ODR chosen and the Oversampling mode, as shown in Table 49.

Table 49. FF_MT_COUNT relationship with the ODR

| ODR <br> (Hz) | Max Time Range (s) |  |  |  | Time Step (ms) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Normal | LPLN | HighRes | LP | Normal | LPLN | HighRes | LP |  |
| 800 | 0.319 | 0.319 | 0.319 | 0.319 | 1.25 | 1.25 | 1.25 | 1.25 |  |
| 400 | 0.638 | 0.638 | 0.638 | 0.638 | 2.5 | 2.5 | 2.5 | 2.5 |  |
| 200 | 1.28 | 1.28 | 0.638 | 1.28 | 5 | 5 | 2.5 | 5 |  |
| 100 | 2.55 | 2.55 | 0.638 | 2.55 | 10 | 10 | 2.5 | 10 |  |
| 50 | 5.1 | 5.1 | 0.638 | 5.1 | 20 | 20 | 2.5 | 20 |  |
| 12.5 | 5.1 | 20.4 | 0.638 | 20.4 | 20 | 80 | 2.5 | 80 |  |
| 6.25 | 5.1 | 20.4 | 0.638 | 40.8 | 20 | 80 | 2.5 | 160 |  |
| 1.56 | 5.1 | 20.4 | 0.638 | 40.8 | 20 | 80 | 2.5 | 160 |  |

Figure 15. DBCNTM bit function

### 6.8 Auto-WAKE/SLEEP detection

### 6.8.1 0x29: ASLP_COUNT, Auto-WAKE/SLEEP Detection register (Read/Write)

The ASLP_COUNT register sets the minimum time period of inactivity required to switch the part between Wake and Sleep status. At the end of the time period, the device switches its ODR rate automatically when the Auto-WAKE /SLEEP function is enabled.

- Wake ODR is set by CTRL_REG1[DR] bits.
- Sleep ODR is set by CTRL_REG1[ASLP_RATE] bits.
- Auto WAKE/SLEEP function is enabled by asserting the CTRL_REG2[SLPE] bit.

Table 50. 0x29 ASLP_COUNT register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $D 7$ | $D 6$ | $D 5$ | $D 4$ | $D 3$ | $D 2$ | $D 1$ | D0 |

Table 51. ASLP_COUNT register

| Bit(s) | Field |  | Description |
| :---: | :---: | :--- | :--- |
| $7-0$ | $D[7: 0]$ | Duration value <br> $0000 \_0000$ (default) |  |

D7-D0 defines the minimum duration time needed to change the current ODR value from DR to ASLP_RATE. The time step and maximum value depend on the ODR chosen (as shown in Table 52).

Table 52. ASLP_COUNT relationship with ODR

| Output Data Rate <br> (ODR) | Duration <br> (sec) | ODR Time Step <br> (ms) | ASLP_COUNT Step <br> (ms) |
| :---: | :---: | :---: | :---: |
| 800 Hz | 0 to 81 | 1.25 | 320 |
| 400 Hz | 0 to 81 | 2.5 | 320 |
| 200 Hz | 0 to 81 | 5 | 320 |
| 100 Hz | 0 to 81 | 10 | 320 |
| 50 Hz | 0 to 81 | 20 | 320 |
| 12.5 Hz | 0 to 81 | 80 | 320 |
| 6.25 Hz | 0 to 81 | 160 | 320 |
| 1.56 Hz | 0 to 162 | 640 | 640 |

For functional blocks that may be monitored for inactivity (to trigger the "return to SLEEP" event), see Table 53.

Table 53. SLEEP/WAKE mode gates and triggers

| Interrupt Source | Will the event restart the timer <br> and delay "Return to SLEEP"? | Will the event <br> WAKE from SLEEP? |
| :--- | :---: | :---: |
| SRC_LNDPRT | Yes | Yes |
| SRC_FF_MT | Yes | Yes |
| SRC_ASLP | No* $^{*}$ | No* $^{*}$ |
| SRC_DRDY | No | No |

- Two interrupt sources can WAKE the device: Orientation and Motion/Freefall. One or more of these functions can be enabled.
- To WAKE the device, the desired function(s) must be enabled in CTRL_REG4 register and set to WAKE-to-SLEEP in CTRL_REG3 register.
- All enabled functions still run in SLEEP mode at the SLEEP ODR.

Only the functions that have been selected for WAKE from SLEEP will actually WAKE the device (as configured in register 0x2C).

- The Auto-WAKE/SLEEP interrupt does not affect the WAKE/SLEEP, nor does the data ready interrupt.

MMA8653FC

## Sensors

- MMA8653FC has two functions that can be used to keep the sensor from falling asleep: Orientation and Motion/Freefall.
- Auto-SLEEP bit:
- If the Auto-SLEEP bit is disabled, then the device can only toggle between STANDBY and WAKE mode.
- If Auto-SLEEP interrupt is enabled, then transitioning from ACTIVE mode to Auto-SLEEP mode (or vice versa) generates an interrupt.

### 6.9 System and control registers

## NOTE

Except for STANDBY mode selection, the device must be in STANDBY mode to change any of the fields within CTRL_REG1 (0x2A).

### 6.9.1 0x2A: CTRL_REG1 System Control 1 register

CTRL_REG1 register configures the Auto-WAKE sample frequency, output data rate selection, and enables the fast-read mode and STANDBY/ACTIVE mode selection.

Table 54. 0x2A CTRL_REG1 register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit $\mathbf{1}$ | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ASLP_RATE1 | ASLP_RATE0 | DR2 | DR1 | DR0 | 0 | F_READ | ACTIVE |

Table 55. CTRL_REG1 register

| Bit(s) | Field | Description |
| :---: | :---: | :---: |
| 7-6 | ASLP_RATE[1:0] | Configures the Auto-WAKE sample frequency when the device is in SLEEP Mode. See Table 56. <br> 00 (default) |
| 5-3 | DR[2:0] | Data rate selection See Table 57. <br> 000 (default) |
| 2 | 0 |  |
| 1 | F_READ | Fast-read mode: Data format is limited to single byte <br> 0 Normal mode (default) <br> 1 Fast Read Mode |
| 0 | ACTIVE | Full-scale selection <br> 0 STANDBY mode (default) <br> 1 ACTIVE mode |

## MMA8653FC

Table 56. SLEEP mode rates

| ASLP_RATE1 | ASLP_RATE0 | Frequency (Hz) |  |
| :---: | :---: | :---: | :--- |
| 0 | 0 | 50 | Notes |
| 0 | 1 | 12.5 |  |
| data rate for all the system functional blocks are overridden by the data |  |  |  |
| rate set by the ASLP_RATE field. |  |  |  |
| 1 | 0 | 6.25 |  |
| 1 | 1 | 1.56 |  |

DR[2:0] bits select the Output Data Rate (ODR) for acceleration samples in WAKE mode. The default value is 000 for a data rate of 800 Hz .

Table 57. System output data-rate selection

| DR2 | DR1 | DR0 | ODR <br> (Hz) | Period <br> $(\mathbf{m s})$ | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 800 | 1.25 | default |
| 0 | 0 | 1 | 400 | 2.5 |  |
| 0 | 1 | 0 | 200 | 5 |  |
| 0 | 1 | 1 | 100 | 10 |  |
| 1 | 0 | 0 | 50 | 20 |  |
| 1 | 0 | 1 | 12.5 | 80 |  |
| 1 | 1 | 0 | 6.25 | 160 |  |
| 1 | 1 | 1 | 1.56 | 640 |  |

The ACTIVE bit selects between STANDBY mode and ACTIVE mode.

Table 58. Full-Scale selection using ACTIVE bit

| Active bit | Mode |
| :---: | :--- |
| 0 | STANDBY (default) |
| 1 | ACTIVE |

- The F_Read bit selects between normal and Fast Read mode.

When selected, the auto-increment counter will skip over the LSB data bytes.
Data read from the FIFO will skip over the LSB data, reducing the acquisition time.

- Note that F_READ can only be changed when FMODE $=00$.
- The F_READ bit applies for the output registers.

### 6.9.2 0x2B: CTRL_REG2 System Control 2 register

CTRL_REG2 register is used to enable Self-Test, Software Reset, and Auto-SLEEP. In addition, it enables you to configure the SLEEP and WAKE mode power scheme selection (oversampling modes).

Table 59. 0x2B CTRL_REG2 register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ST | RST | - | SMODS1 | SMODS0 | SLPE | MODS1 | MODS0 |

Table 60. CTRL_REG2 register

| Bit(s) | Field | Description |
| :---: | :---: | :---: |
| 7 | ST | Self-Test Enable <br> Activates the self-test function. <br> - When ST is set, the $\mathrm{X}, \mathrm{Y}$, and Z outputs will shift. <br> 0 Self-Test disabled (default) <br> 1 Self-Test enabled |
| 6 | RST | Software Reset <br> RST bit is used to activate the software reset. <br> - The reset mechanism is enabled in both STANDBY and ACTIVE modes. <br> 0 Device reset disabled (default) <br> 1 Device reset enabled. |
| 5 | - | Could be 0 or 1. |
| 4-3 | SMODS[1:0] | SLEEP mode power scheme selection See Table 61 and Table 62 00 (default) |
| 2 | SLPE | Auto-SLEEP enable <br> 0 Auto-SLEEP is not enabled (default) <br> 1 Auto-SLEEP is enabled. |
| 1-0 | MODS[1:0] | ACTIVE mode power scheme selection See Table 61 and Table 62 00 (default) |

When the reset bit is enabled, all registers are reset and are loaded with default values. Writing ' 1 ' to the RST bit immediately resets the device, no matter whether it is in ACTIVE/WAKE, ACTIVE/SLEEP, or STANDBY mode.
The $\mathrm{I}^{2} \mathrm{C}$ communication system is reset to avoid accidental corrupted data access.
At the end of the boot process the RST bit is deasserted to 0 . Reading this bit will return a value of zero.
The (S)MODS[1:0] bits select which Oversampling mode is to be used, as shown in Table 61. The Oversampling modes are available in both WAKE Mode MOD[1:0] and also in the SLEEP Mode SMOD[1:0].

Table 61. (S)MODS Oversampling modes

| (S)MODS1 | (S)MODS0 | Power Mode |
| :---: | :---: | :--- |
| 0 | 0 | Normal |
| 0 | 1 | Low Noise Low Power |
| 1 | 0 | High Resolution |
| 1 | 1 | Low Power |

## MMA8653FC

Table 62. MODS Oversampling modes averaging values at each ODR

| ODR <br> (Hz) | Normal (00) |  | Low Noise Low Power (01) | High Resolution (10) |  | Low Power (11) |  |  |

|  | Current $\mu \mathbf{A}$ | OS Ratio | Current $\mu \mathbf{A}$ | OS Ratio | Current $\mu \mathbf{A}$ | OS Ratio | Current $\mu \mathbf{A}$ | OS Ratio |
| 1.56 | 27 | 128 | 9 | 32 | 184 | 1024 | 6.5 | 16 |
| 6.25 | 27 | 32 | 9 | 8 | 184 | 256 | 6.5 | 4 |
| 12.5 | 27 | 16 | 9 | 4 | 184 | 128 | 6.5 | 2 |
| 50 | 27 | 4 | 27 | 4 | 184 | 32 | 15 | 2 |
| 100 | 49 | 4 | 49 | 4 | 184 | 16 | 26 | 2 |
| 200 | 94 | 4 | 94 | 4 | 184 | 8 | 49 | 2 |
| 400 | 184 | 4 | 184 | 4 | 184 | 4 | 94 | 2 |
| 800 | 184 | 2 | 184 | 2 | 184 | 2 | 184 | 2 |

### 6.9.3 0x2C: CTRL_REG3 Interrupt Control register

CTRL_REG3 register is used to control the Auto-WAKE/SLEEP function by setting the orientation or Freefall/Motion as an interrupt to wake. CTRL_REG3 register also configures the interrupt pins INT1 and INT2.

Table 63. 0x2C CTRL_REG3 register (Read/Write)
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit $\mathbf{1}$ | Bit 0 |

| 6 | - | Could be 0 or 1. |  |
| 5 | - | Could be 0 or 1. | Note: The corresponding functional block interrupt |
| 4 | INT_EN_LNDPRT | Orientation (Landscape/Portrait) Interrupt Enable | enable bit enables the functional block to route |
| 3 | - | Could be 0 or 1. | nt detection flags to the system's interrupt ler. The interrupt controller routes the |
| 2 | INT_EN_FF_MT | Freefall/Motion Interrupt Enable | enabled functional block interrupt to the INT1 or |
| 0 | INT_EN_DRDY | Data Ready Interrupt Enable | INT2 pin. |

### 6.9.5 0x2E CTRL_REG5 Interrupt Configuration register (Read/Write)

CTRL_REG5 register maps the desired interrupts to INT2 or INT1 pins.
The system's interrupt controller, shown in Figure 9, uses the corresponding bit field in the CTRL_REG5 register to determine the routing table for the INT1 and INT2 interrupt pins.

- If the bit value is 0 , then the functional block's interrupt is routed to INT2.
- If the bit value is 1 , then the functional block's interrupt is routed to INT1.

One or more functions can assert an interrupt pin; therefore a host application responding to an interrupt should read the INT_SOURCE $(0 \times 0 C)$ register, to determine the appropriate sources of the interrupt.

Table 67. 0x2E: CTRL_REG5 Interrupt Configuration register
Back to Register Address Map

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

## MMA8653FC

### 6.10 Data calibration registers

The 2's complement offset correction registers values are used to realign the Zero-g position of the $\mathrm{X}, \mathrm{Y}$, and Z -axis after the device is mounted on a board. The resolution of the offset registers is $1.96 \mathrm{mg} / \mathrm{LSB}$. The 2's complement 8 -bit value would result in an offset compensation range $\pm 250 \mathrm{mg}$ for each axis.

## 7 Mounting Guidelines

Surface mount printed circuit board (PCB) layout is a critical portion of the total design. The footprint for the surface mount packages must be the correct size to ensure proper solder connection interface between the PCB and the package. With the correct footprint, the packages will self-align when subjected to a solder reflow process. These guidelines are for soldering and mounting the Dual Flat No-Lead (DFN) package inertial sensors to PCBs. The purpose is to minimize the stress on the package after board mounting. The MMA865xFC digital output accelerometers use the DFN package platform. This section describes suggested methods of soldering these devices to the PCB for consumer applications.

### 7.1 Overview of soldering considerations

Information provided here is based on experiments executed on DFN devices. They do not represent exact conditions present at a customer site. Therefore, this information should be used as guidance only and process and design optimizations are recommended to develop an application specific solution. It should be noted that with the proper PCB footprint and solder stencil designs, the package will self-align during the solder reflow process.

### 7.2 Halogen content

This package is designed to be Halogen Free, exceeding most industry and customer standards. Halogen Free means that no homogeneous material within the assembly package shall contain chlorine (CI) in excess of 700 ppm or $0.07 \%$ weight/weight or bromine ( Br ) in excess of 900 ppm or $0.09 \%$ weight/weight.

### 7.3 PCB mounting/soldering recommendations

1. The PCB land should be designed as Non Solder Mask Defined (NSMD) as shown in Figure 16.
2. No additional via pattern underneath package.
3. PCB land pad is $0.6 \mathrm{~mm} \times 0.225 \mathrm{~mm}$ as shown in Figure 16.
4. Solder mask opening $=P C B$ land pad edge +0.125 mm larger all around $=0.725 \mathrm{~mm} \times 1.950 \mathrm{~mm}$
5. Stencil opening $=P C B$ land pad -0.05 mm smaller all around $=0.55 \mathrm{~mm} \times 0.175 \mathrm{~mm}$.
6. Stencil thickness is 100 or $125 \mu \mathrm{~m}$.
7. Do not place any components or vias at a distance less than 2 mm from the package land area. This may cause additional package stress if it is too close to the package land area.
8. Signal traces connected to pads are as symmetric as possible. Put dummy traces on NC pads, to have same length of exposed trace for all pads.
9. Use a standard pick and place process and equipment. Do not use a hand soldering process.
10. Use caution when putting an assembled PCB into an enclosure, noting where the screw-down holes are and if any press-fitting is involved. It is important that the assembled PCB remain flat after assembly, to ensure optimal electronic operation of the device.
11. The PCB should be rated for the multiple lead-free reflow condition with max $260^{\circ} \mathrm{C}$ temperature.
12. No copper traces on top layer of PCB under the package. This will cause planarity issues with board mount. Freescale DFN sensors are compliant with Restrictions on Hazardous Substances (RoHS), having halide free molding compound (green) and lead-free terminations. These terminations are compatible with tin-lead ( $\mathrm{Sn}-\mathrm{Pb}$ ) as well as tin-silver-copper (Sn-Ag-Cu) solder paste soldering processes. Reflow profiles applicable to those processes can be used successfully for soldering the devices.

## MMA8653FC

Figure 16. Package mounting measurements
Table 75. Board mounting guidelines

| Description | Value (mm) |
| :--- | :---: |
| Landing Pad Width | 0.225 |
| Landing Pad Length | 0.600 |
| Solder Mask Pattern Width | 0.725 |
| Solder Mask Pattern Length | 1.950 |
| Landing Pad Extended Length | 0.200 |
| I/O Pads Extended Length | $\mathbf{2 . 5 2 5}$ |

```
NOTES:
1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
3. THIS IS NON JEDEC REGISTERED PACKAGE.
4. COPLANARITY APPLIES TO ALL TERMINALS.
5. THIS DIMENSION APPLIES TO METALLIZED TERMINAL AND IS MEASURE BETWEEN 0.15 AND O.25
    FROM THE TERMINAL TIP. IF THE TERMINAL HAS THE OPTIONAL RADIUS ON THE OTHER END
    OF THE TERMINAL, THIS DIMENSION SHALL NOT BE MEASURED IN THE RADIUS AREA.
6. PIN }1\mathrm{ ID ON TOP WILL BE LASER MARKED.

## 10 Revision History

Table 76. Revision history for MMA8653FC

| Revision number | Revision date | Description of changes |
| :---: | :---: | :---: |
| 0 | 08/2012 | - Initial release. |
| 1.0 | 02/2013 | - Title and introductory text, changed 12-bit to 10 -bit. <br> - Feature comparison table: Orientation Detection features (2) rewritten for clarification. <br> - Section 1: Topics reordered for clarification and consistency. <br> - Table 4: Self-Test Output Change, x, y, and z specification values changed. <br> - Tables 8, 9: Changed units to emg/LSB. <br> - Section 5.5: Freefall detection rewritten for clarification. <br> - Section 5.6 Orientation detection rewitten for clarification. <br> - Section 6.4: FIFO-related content deleted. <br> - Section 6.5.1: FIFO-related content deleted. <br> - Table 19: bit field values deleted. <br> - Section 6.7.4: rewritten for clarification. <br> - Section 6.8.2: replaced Figure 32. <br> - Table 32: FIFO-related content deleted. <br> - Section 6.10.1: FIFO-related content deleted. <br> - Note following Table 39: deleted as unnecessary. |
| 2.0 | 06/2014 | - Section 1.2: Updated Descriptions for Pins 3 and 4. <br> - Section 6.9.2: Replaced contents of Table 64. |
| 2.1 | 12/2014 | - Section 6.74: Corrected value in paragraph following Table 46, was 0.63 to 0.063. |
| 2.2 | 03/2015 | - Section 5.8: Updated paragraph before Table 11. |
